Question What are the main types of engineering materials used in manufacturing? The primary types include metals (ferrous and non-ferrous), ceramics, polymers, and composites. Each type has unique properties suitable for specific applications. How is hardness measured in materials, and what are common hardness testing methods? Hardness is measured to assess a material's resistance to deformation. Common methods include Brinell, Rockwell, Vickers, and Knoop hardness tests, each suited for different material types and thicknesses. What is the significance of tensile testing in an engineering materials lab? Tensile testing evaluates a material's strength, ductility, and elastic properties by applying a uniaxial load until fracture, providing critical data for material selection and design. Explain the concept of elastic and plastic deformation. Elastic deformation is reversible, where a material returns to its original shape after removing load. Plastic deformation is permanent, occurring when a material deforms beyond its elastic limit. How do you determine the grain size of a metallic material in the lab? Grain size is typically determined using a microscope and the Heyn or ASTM grain size charts by analyzing a polished and etched specimen to count the number of grains over a known area. What is the purpose of using a vernier caliper and a micrometer in measurement labs? A vernier caliper is used for measuring external and internal dimensions with moderate precision, while a micrometer provides more precise measurements of small dimensions, typically to the nearest hundredth of a millimeter. Describe the principle of ultrasonic testing and its application in materials testing. Ultrasonic testing uses high-frequency sound waves transmitted into a material. Echoes from flaws or boundaries are detected to identify internal defects, making it useful for non-destructive testing of welds and structures. Why is calibration important in measurement labs, and how is it performed? Calibration ensures measurement accuracy by comparing instruments against standard references. It is performed by using certified calibration standards and adjusting the instrument to align with known values.
