### Materials Required

- Beakers or shallow dishes
- Water
- Thermometer
- Timer/stopwatch
- Humidifier or desiccant (optional)
- Access to different temperature environments

### Procedure

- Fill beakers with equal amounts of water.
- Place the beakers in different environments with varying temperatures or expose them to different surface areas (e.g., using different sizes or shapes of dishes).
- Record initial water levels.
- Start the timer and note the water level at regular intervals (e.g., every 30 minutes).
- Observe how factors like temperature and surface area influence the rate of evaporation.

### Expected Outcome

An increase in temperature or surface area typically leads to a higher rate of evaporation, demonstrating the effect of these variables.

## 2. Measurement of the Acceleration Due to Gravity Using a Pendulum

### Objective

To determine the acceleration due to gravity ( $g$ ) using a simple pendulum.

## Materials Required

- String (about 1-2 meters)
- Rigid support stand or hook
- Small dense object (bob) like a metal washer
- Stopwatch
- Meter scale or ruler

## Procedure

- Attach the bob to one end of the string and suspend it from the support stand.
- Measure the length (L) of the pendulum from the point of suspension to the center of the bob.
- Pull the pendulum back to a small angle (less than 15°) and release without pushing.
- Use the stopwatch to measure the time (T) for 20 oscillations.
- Calculate the period (T?) of one oscillation:  $T? = T / 20$ .
- Use the formula:  $g = (4\pi^2 L) / T^2$  to compute the acceleration due to gravity.

## Notes

Ensure the angle of displacement is small for accurate results and repeat the experiment for consistency.

## 3. Exploring Ohm's Law through Electrical Circuits

### Objective

To verify Ohm's Law by studying the relationship between voltage, current, and resistance.

### Materials Required

- Battery or power supply
- Resistors of known resistance
- Ammeter (for measuring current)
- Voltmeter (for measuring voltage)
- Connecting wires
- Switch

### Procedure

- Connect the resistor into the circuit with the power supply, ammeter, and voltmeter as per the circuit diagram.
- Close the switch to allow current flow and record the voltage across the resistor and the current through it.
- Vary the voltage by adjusting the power supply and record the corresponding current for each voltage level.
- Plot a graph of voltage (V) versus current (I).
- Calculate the resistance using  $R = V / I$  and verify if it remains constant.

## Outcome

A linear V-I graph confirms Ohm's Law, indicating that voltage is directly proportional to current for the resistor.

## 4. Investigating Properties of Acids and Bases

### Objective

To identify acids and bases using indicators and observe their properties.

### Materials Required

- Common acids (e.g., vinegar, lemon juice)
- Common bases (e.g., baking soda solution, soap solution)

### Procedure

- Place small samples of each solution in separate test tubes.
- Use litmus paper or universal pH indicator to test each solution.
- Record the color change and pH value if using a pH meter.
- Identify which solutions are acids, bases, or neutral based on the results.

### Notes

Handle acids and bases with care, following safety protocols, and dispose of solutions appropriately.

## 5. Study of Simple Machines and Mechanical Advantage

## Objective

To understand how simple machines reduce effort and increase mechanical advantage.

## Materials Required

- Inclined plane
- Pulley system
- Rope and weights
- Force meter or spring balance

## Procedure

- Set up the inclined plane and record the effort needed to move a load up the plane.
- Calculate the mechanical advantage:  $MA = \text{load force} / \text{effort force}$ .
- Repeat with different setups, such as using pulleys, to observe changes in effort and advantage.

## Expected Outcomes

Simple machines help reduce the effort needed to move loads, illustrating the principle of mechanical advantage.
