Introduction to Solubility

What is Solubility?

Solubility refers to the maximum amount of a solute that can dissolve in a solvent at a given temperature and pressure to form a saturated solution. It is typically expressed in units such as grams per 100 milliliters (g/100 mL) of solvent, molarity (mol/L), or molality (mol/kg). The degree of solubility varies widely among different substances and is influenced by numerous factors.

His research has elucidated the relationship between molecular structure and solubility, as well as the thermodynamic parameters that influence dissolution processes.

Fundamental Principles of Solubility

Factors Affecting Solubility

Several key factors influence how well a substance dissolves in a solvent, including:

- **Nature of the Solute and Solvent:** Similarity in chemical nature (like dissolves like) enhances solubility.
- **Temperature:** Usually, increasing temperature increases solubility for solids and liquids but may decrease it for gases.

- **Pressure:** Primarily affects gases; higher pressure increases gas solubility.
- **Particle Size:** Smaller particles dissolve faster due to higher surface area.
- **Presence of Other Substances:** Impurities and other solutes can alter solubility through common ion effects or complex formation.

Types of Solubility

Solubility can be categorized based on the nature of the solute:

- **Solubility of Solids in Liquids:** Typically increases with temperature.
- **Solubility of Gases in Liquids:** Usually decreases with temperature but increases with pressure.
- **Solubility of Liquids in Liquids:** Depends on polarity and intermolecular forces.

- The relation is given by: $\Delta G = \Delta H - T \Delta S$, where ΔH is enthalpy change, and ΔS is entropy change.

Ak Gupta's studies demonstrated how both enthalpy and entropy influence solubility, with particular attention to the balance between these parameters.

Solubility Product (K_{sp})

For sparingly soluble salts, Ak Gupta contributed to understanding the solubility product constant (K_{sp}), which indicates the degree of solubility:

- At equilibrium, the ionic concentrations of the dissolved ions satisfy the expression for K_{sp} .
- The smaller the K_{sp} , the less soluble the salt.

His research clarified how temperature variations affect K_{sp} and, consequently, the solubility of salts.

Methods of Determining Solubility
