- Compute discriminant and solutions.

Difficulty Level: Moderate; suitable for Grade 10 students with foundational algebra skills.

Sample Question:

Given $f(x) = 3x + 2$, find $f^{-1}(x)$.

Analysis:

This tests understanding of inverse functions, a key concept in algebra. Students must swap variables and solve for the new function.

Expected Approach:

- Let $y = 3x + 2$.
- Swap: $x = 3y + 2$.
- Solve for y : $y = \frac{x - 2}{3}$.
- Write the inverse: $f^{-1}(x) = \frac{x - 2}{3}$.

Difficulty Level: Slightly challenging, requiring conceptual clarity about inverse functions.

Geometry and Trigonometry

Sample Question:

A triangle has sides of lengths 7 cm, 24 cm, and 25 cm. Verify whether the triangle is right-angled.

Difficulty Level: Basic application of right-angled triangle properties.

Data Handling and Probability

Sample Question:

A bag contains 5 red, 3 blue, and 2 green balls. If two balls are drawn at random without replacement, what is the probability that both are red?

Analysis:

This assesses understanding of probability principles, especially with dependent events.

Expected Approach:

- Total balls = $5 + 3 + 2 = 10$.
- Probability first ball is red: $(\frac{5}{10})$.
- After drawing one red ball, remaining red balls = 4, total remaining balls = 9.
- Probability second ball is red: $(\frac{4}{9})$.
- Overall probability: $(\frac{5}{10} \times \frac{4}{9} = \frac{20}{90} = \frac{2}{9})$.
